Bands X730, X786, and X860 do not appear on the photographic plate, and the last two seem never to have been detected before. The above wave-lengths are given as in the tables. The salts of neodymium were studied as far as X20000, but beyond 1// there seems to be complete transparency. The absorption of water is, as is well known, very great in the region X12000 to X20000. DISCUSSION OF THE RESULTS. The results are plotted in figs. 1 to 11. The abscissae are percentage transparencies, the ordinates are wave-lengths. These curves, since they represent the transparencies of the solutions in question, are called transmission curves. Figs. 1, 2, and 3 represent the transparency of solutions of neodymium chloride expressed in terms of Beer's law. If we represent the concentration by N and the depth of layer by d, $Nd = \text{constant}$ The concentration represented in fig. 11 is 3.43 normal, in fig. 2 it is 0.857 normal, and in fig. 3 it is 0.427 normal. The depth of layer represented by fig. 1 is 2.5 mm., by fig. 2 it is 10 mm., and by fig. 3 it is 20 mm. The concentration and depth of layer were thus varied so as to keep Nd constant. If the solvent plays no role in the absorption, the three sets of curves must fall directly over one another, i. e., be identical, since the number of absorbing parts...
