Not illustrated. 1914 Excerpt: .is realjy not a photometer and is used only as a guide in works control. The open-bar instrument is most commonly employed, and is preferable to all other forms for gas testing. It has the advantage over the closed bar of giving better ventilation to flames, less temperature change about the flame, and no chance for reflection of light into the sight box from the gallery. Although the closed-bar instrument is slightly cheaper and the flames are less disturbed by drafts in the room, these advantages are less important than those which favor an open bar. By proper setting of screens on an open-bar instrument, the latter can be used with accuracy in a room only partially darkened and without blackened walls, with as great ease and satisfaction as can the inclosed bar form. (See p. 104 for discussion of screens.) The portable photometer may be used advantageously in many cases, but it is somewhat less reliable than the stationary open-bar type. In cities where a permanent equipment is necessary, the portable form is not used for official testing and, in general, it should not be used when a fixed apparatus can be secured. Some portable instruments suitable for state inspector s use and for testing in various parts of a city will be described. For official testing a jet photometer is not suitable, since it is not really a photometer but must itself be calibrated by a photometer. If properly used, it may be a...
