RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 180 pages. Original publisher: Seattle, Wash. : Environmental Conservation Division, Northwest Fisheries Center, National Marine Fisheries Service, National Oceanic and Atmospheric Administration, 1990 OCLC Number: (OCoLC)605974698 Subject: Fishes -- Effect of oil spills on -- Alaska -- Alaska, Gulf of. Excerpt: . . . 4 EXPERIMENTAL METHODS Details of protocols for the field sampling, chemical analyses, and statistical evaluation are outlined below. These protocols have also been briefly described in the periodic reports (Varanasi et al. 1989b-e) issued throughout the study. Field Sample Collection Under contract with Exxon, Dames and Moore biologists collected samples of fish (Table 2) and shellfish (Table 3) from subsistence fishing areas near native Alaskan villages (Fig. 1). Generally, at least two sites were sampled per village with assistance of NOAA or State of Alaska field biologists. Bile samples from these fish were usually screened for metabolites of ACs (see below) to indicate the priority by which samples of edible fish flesh should be subjected to a more detailed analysis; however, Cycle I sampling was completed before this-protocol could be fully implemented. Otherwise, samples of bile and flesh were chilled in the field, frozen before shipment, and stored frozen in the laboratory until analyzed. Shellfish samples were composites of whole individual animals, while fish were sampled as individuals for shipment. Bile Analyses Fish bile samples were analyzed for fluorescent ACs (FACs) by the metho of Krahn et al. (1986a) outlined below. Bile collected from the fish was stored at, the laboratory at-80 C until analyzed. Fluorescent Aromatic Contaminant Determinations 1 The FACs in bile were analyzed on a Waters high performance liquid chromatograph equipped with a Perkin-Elmer HC-ODS PAH column...
